

ENGLISH

CUEVO Lyrics

User tutorial - English

This tutorial walks through the whole workflow: install, connect to Resolume, find lyrics, build a show, run it live, style it, and send it to OBS or TikTok Live.

Every screenshot in this document is from the app itself, running with real output and real song data, not mockups.

Before you start

Windows

Required for Spout output. On other systems the app opens and you can search and edit lyrics, but the Start output button stays disabled.

Resolume Arena

Any version with a Spout receiver.

The app itself

Download the .exe from the Releases page and unzip it, or run from source with Python 3.9 or newer, 64-bit.

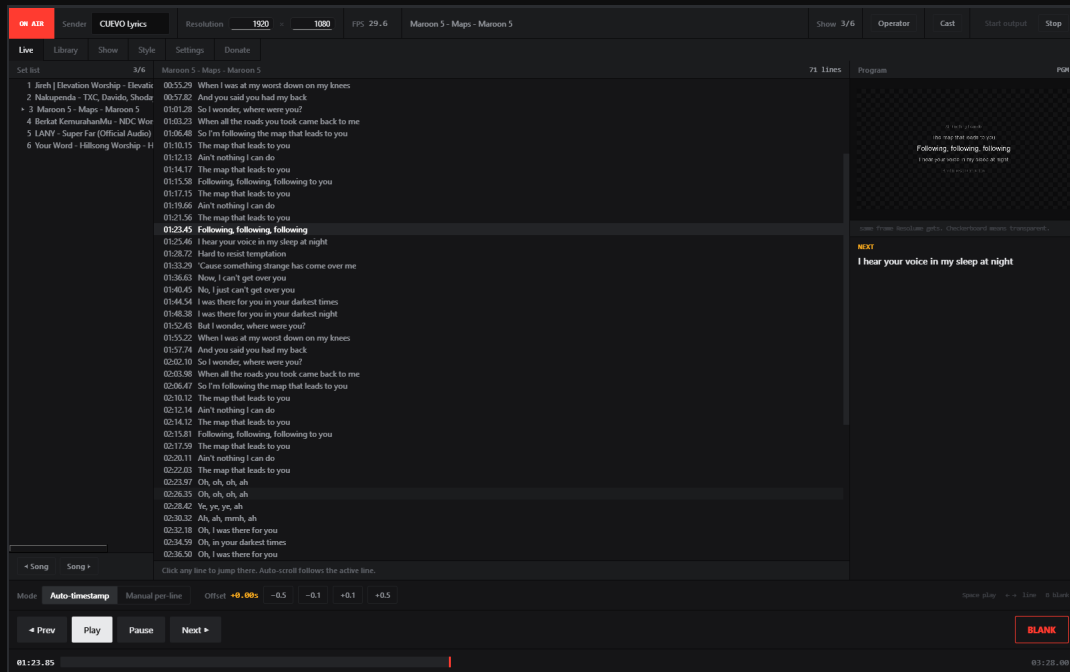

No installer, nothing written outside your user folder. Windows may show a SmartScreen warning on first run because the build is not code signed; click More info, then Run anyway.

Connecting to Resolume Arena

- 1 Press Start output in CUEVO Lyrics. The status strip switches from IDLE to ON AIR.
- 2 In Resolume, right-click a layer, a clip, or an empty slot.
- 3 Pick Sources > Spout.
- 4 Choose the sender name shown in the Settings tab. The default is “CUEVO Lyrics”.

The lyrics arrive as a clip with a transparent background, so you can stack them over whatever else your set is running.

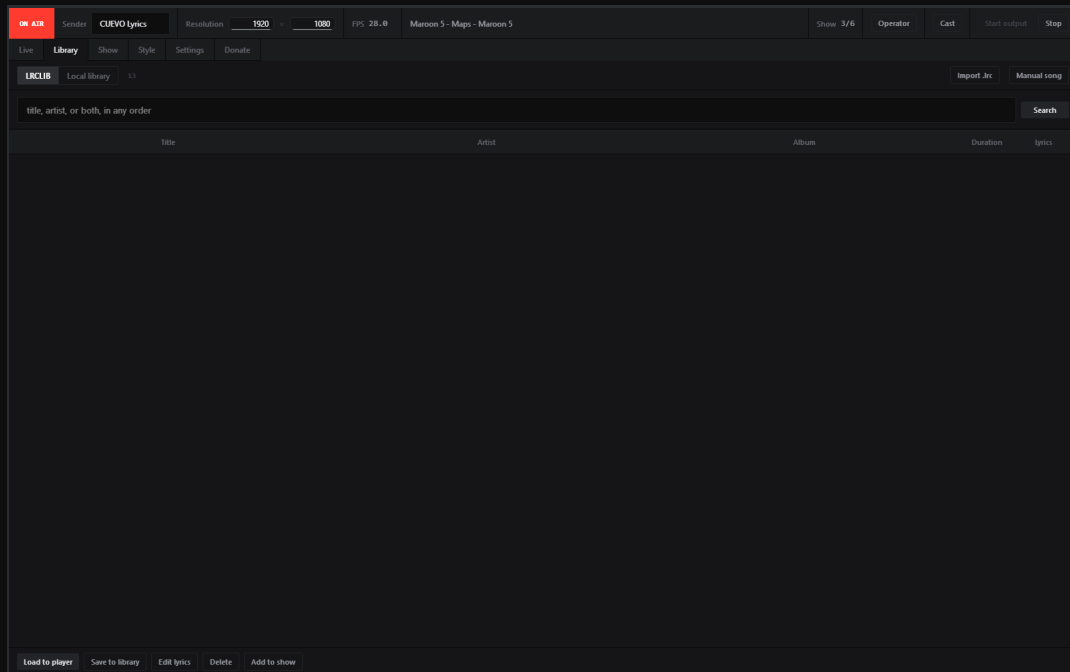

1. The Live tab

This is where you run the show. The set list sits on the left; click any song to load it. The middle column shows every line of the current song with its timestamp; click any line to jump straight to it. The right column is a live preview of the exact frame Resolume is receiving, not an approximation of it.

Press Play when the song actually starts. If the lyrics drift, nudge them back into sync with the offset buttons (-0.5s / -0.1s / +0.1s / +0.5s) without stopping playback. BLANK, on the far right, empties the output instantly without losing your position in the song. Use it for instrumental sections or between songs.

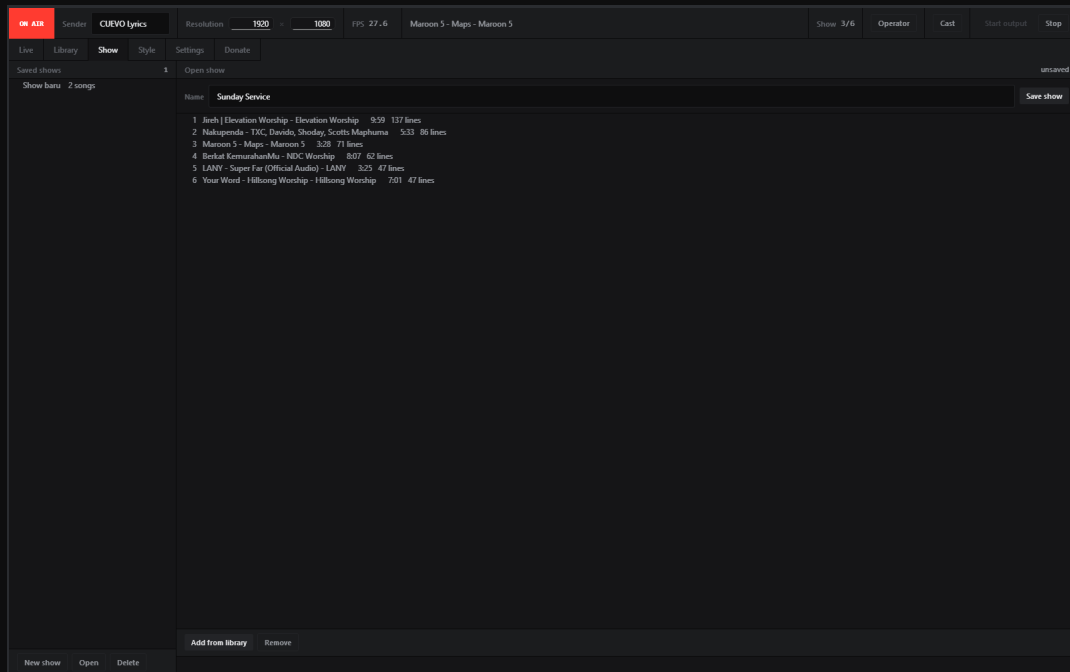

2. Finding and adding lyrics

The Library tab searches LRCLIB with a single free-form box: type a title, an artist, or both, in any order. Results show whether a match has synced timestamps or plain text only. Songs you save stay in your local library and keep working even if LRCLIB is unreachable.

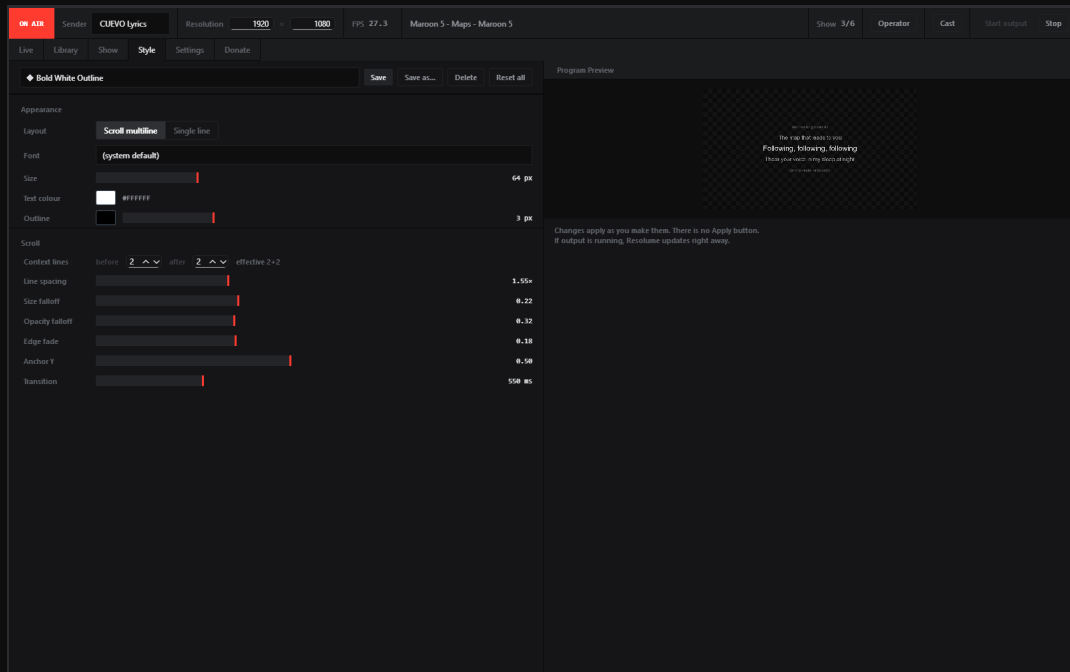

No match online? Open the manual editor to write lyrics yourself and tap out the timestamps as the song plays. From either the search results or your library, use “Add to show” to place a song directly into the set list you have open.

3. Building a Show

A Show is your running order for one event. Add songs from the library, drag to reorder them, then save the whole thing to a file you can reopen next week. Song navigation during the actual show happens from the Live tab, on purpose, so the running order cannot get bumped out of place by accident mid-set.

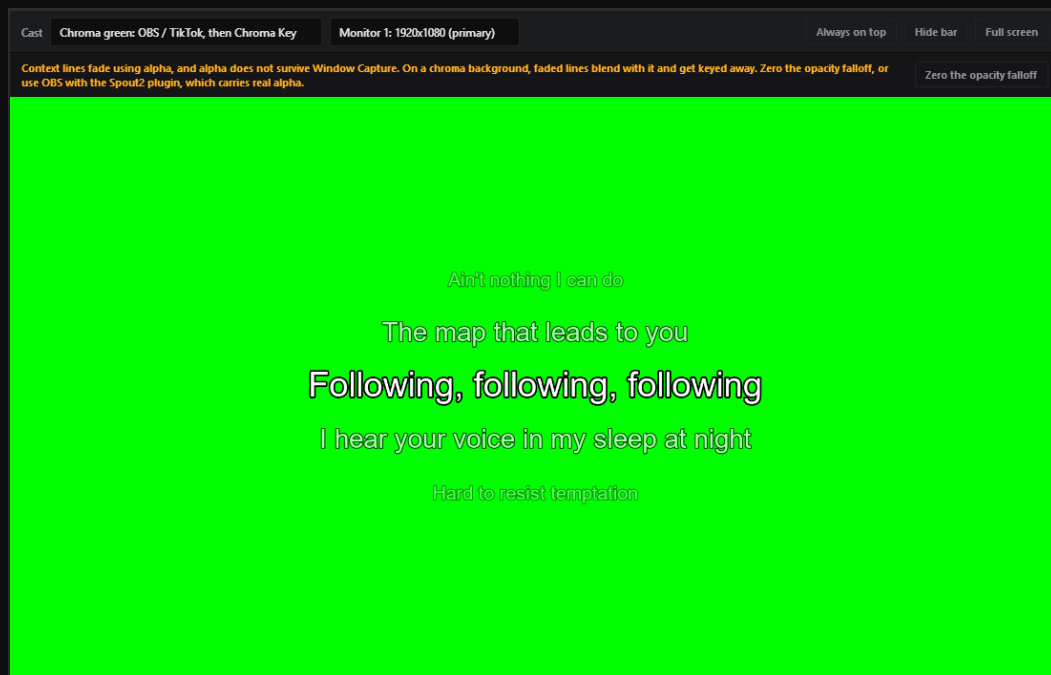

4. Styling the output

Everything visual lives here: layout (multi-line scroll or single line), font, size, text and outline colour, line spacing, how quickly context lines shrink and fade, and transition speed. Changes apply the moment you make them, including while output is running, so you can adjust live and watch the preview react instantly.

Right-click any control to reset it to its default, the same gesture Resume Arena itself uses. Save a set of values as a Template so you do not have to rebuild your look for the next show.

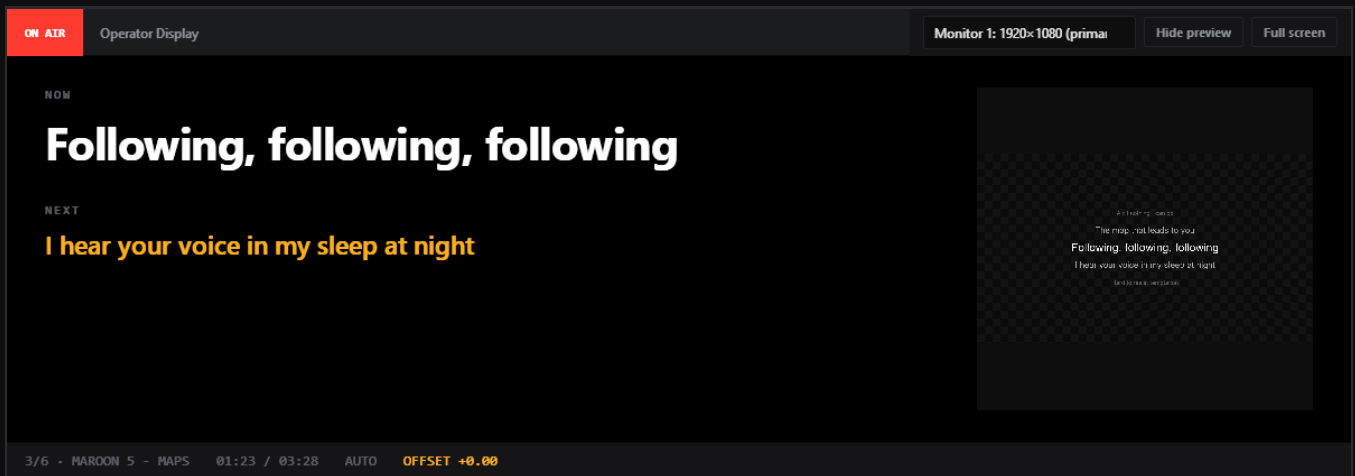

5. Sending it to OBS or TikTok Live

The Cast button opens a separate capturable window. Pick Chroma green for OBS Window Capture with a Chroma Key filter, or for TikTok Live Studio's Screen or Window Capture. Pick Black and a monitor for a second screen or projector. Hide bar strips the window frame for a clean capture; Esc brings it back.

If you use the Spout2 plugin in OBS instead, skip this window entirely and add a Spout source pointed at the "CUEVO Lyrics" sender: it carries real transparency and needs no chroma key at all.

6. Operator Display

A simple NOW/NEXT window meant for a second monitor, so whoever is calling the show can see what is playing and what comes next without looking at the main control window. The bottom bar shows song position, elapsed time, sync mode, and the current offset.

Troubleshooting

“SpoutGL/pygame not installed”

The optional Windows packages are missing. Reinstall with `pip install -r requirements.txt` on 64-bit Windows, or use the prebuilt .exe from the Releases page instead.

Resolume cannot see the sender

Check that Start output was pressed, so the status strip reads ON AIR rather than IDLE, and that the small pygame window is still open. Minimising it is fine; closing it is not.

Lyrics not found on LRCLIB

Drop extras like “(Official Video)” from the search. The search box takes title and artist together in any order.

Frame rate drops during animation

Avoid effective font sizes below about 22px. The Style panel warns you automatically when a setting is about to cross that line.

Windows warns “Unknown publisher” on first run

The build is not code signed. Click More info, then Run anyway. If you would rather not trust a binary from a stranger, the source is public and you can build it yourself.

INDONESIA

CUEVO Lyrics

Tutorial pengguna - Bahasa Indonesia

Tutorial ini membahas alur kerja lengkapnya: pasang, sambungkan ke Resolume, cari lirik, susun show, jalankan live, atur tampilan, dan kirim ke OBS atau TikTok Live.

Setiap tangkapan layar di dokumen ini diambil langsung dari aplikasinya yang berjalan sungguhan, dengan output dan data lagu nyata, bukan rekaan.

Sebelum mulai

Windows

Dibutuhkan untuk output Spout. Di sistem lain aplikasinya tetap terbuka dan kamu bisa mencari dan mengedit lirik, tapi tombol Start output tetap nonaktif.

Resolume Arena

Versi apa pun yang punya Spout receiver.

Aplikasinya sendiri

Unduh .exe dari halaman Releases lalu unzip, atau jalankan dari source dengan Python 3.9 ke atas, 64-bit.

Tidak ada installer, tidak ada yang ditulis di luar folder user-mu. Windows mungkin memperingatkan SmartScreen saat pertama dijalankan karena build-nya tidak ditandatangani; klik More info, lalu Run anyway.

Menyambung ke Resolume Arena

- 1 Tekan Start output di CUEVO Lyrics. Status strip berubah dari IDLE jadi ON AIR.
- 2 Di Resolume, klik kanan sebuah layer, clip, atau slot kosong.
- 3 Pilih Sources > Spout.
- 4 Pilih nama sender yang tertulis di tab Settings. Default-nya “CUEVO Lyrics”.

Liriknya datang sebagai clip berlatar transparan, jadi bisa ditumpuk di atas visual lain yang sedang berjalan di set-mu.

◀ Prev Play Pause Next ▶

01:23.85

01:28.00

01:23:85

01:28:00

Di sinilah kamu menjalankan show. Set list ada di kiri, klik lagu mana pun untuk memuatnya. Kolom tengah menampilkan setiap baris lagu yang sedang aktif beserta timestamp-nya; klik baris mana pun untuk langsung lompat ke situ. Kolom kanan adalah preview langsung dari frame persis yang diterima Resolume, bukan perkiraan.

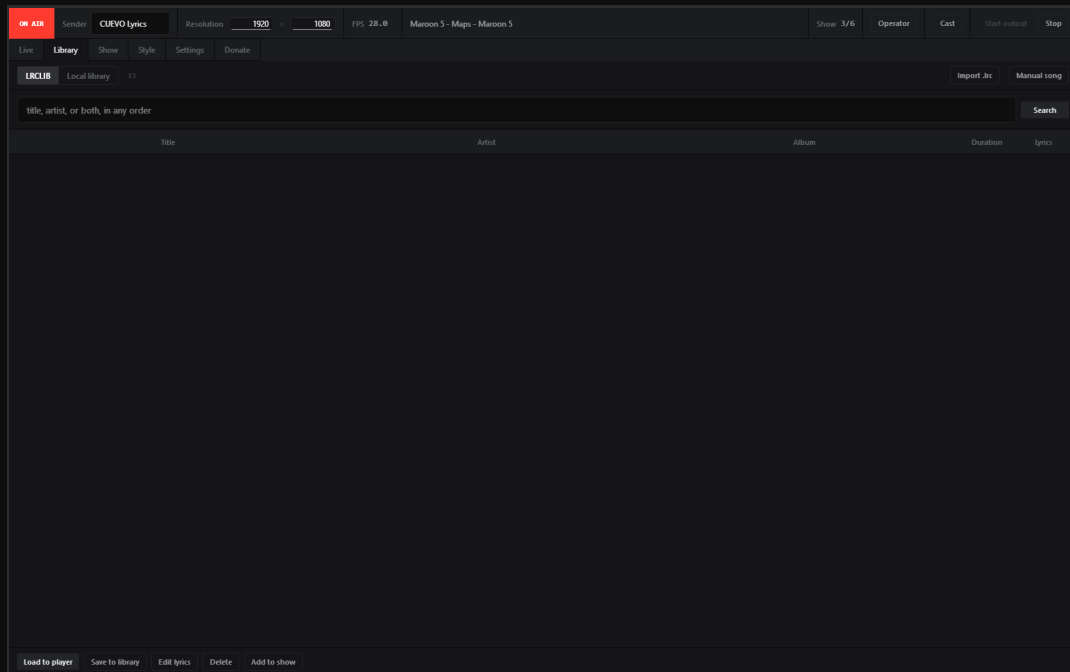

Tekan Play saat lagunya benar-benar mulai. Kalau liriknya melenceng, betulkan dengan tombol offset (-0.5s / -0.1s / +0.1s / +0.5s) tanpa menghentikan pemutaran. BLANK di paling kanan mengosongkan output seketika tanpa kehilangan posisi di lagu. Pakai ini untuk bagian instrumental atau di antara lagu.

Tab Live

15

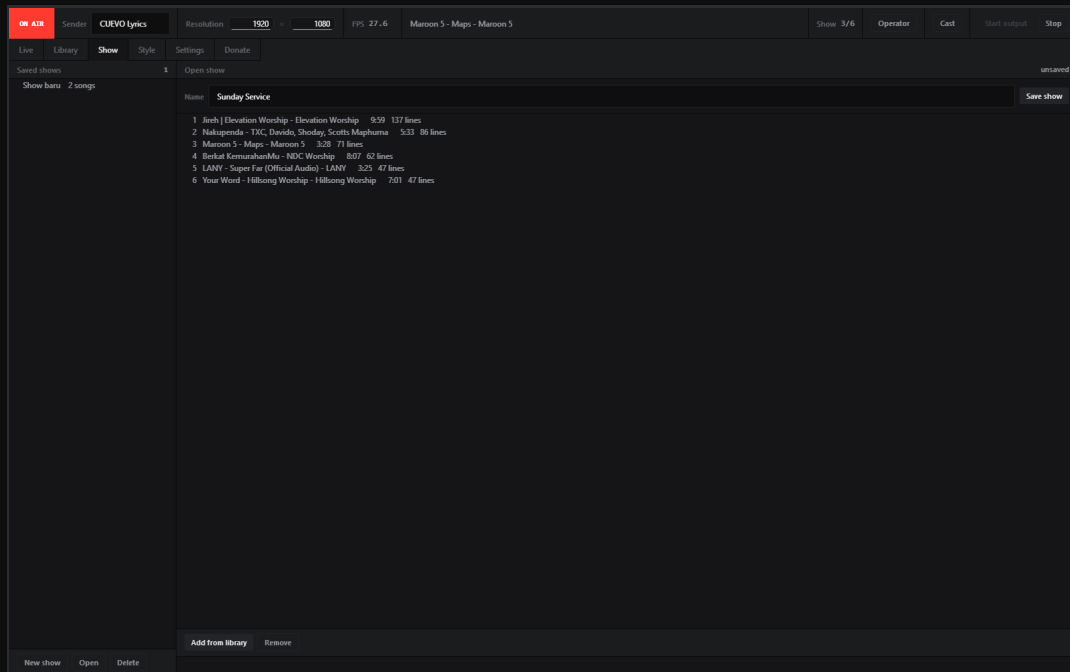

2. Mencari dan menambahkan lirik

Tab Library mencari di LRCLIB lewat satu kolom bebas: ketik judul, artis, atau keduanya, urutan apa saja. Hasil pencarian menunjukkan apakah lagunya punya timestamp tersinkron atau cuma teks polos. Lagu yang kamu simpan masuk ke library lokal dan tetap bisa dipakai walau LRCLIB sedang tidak bisa diakses.

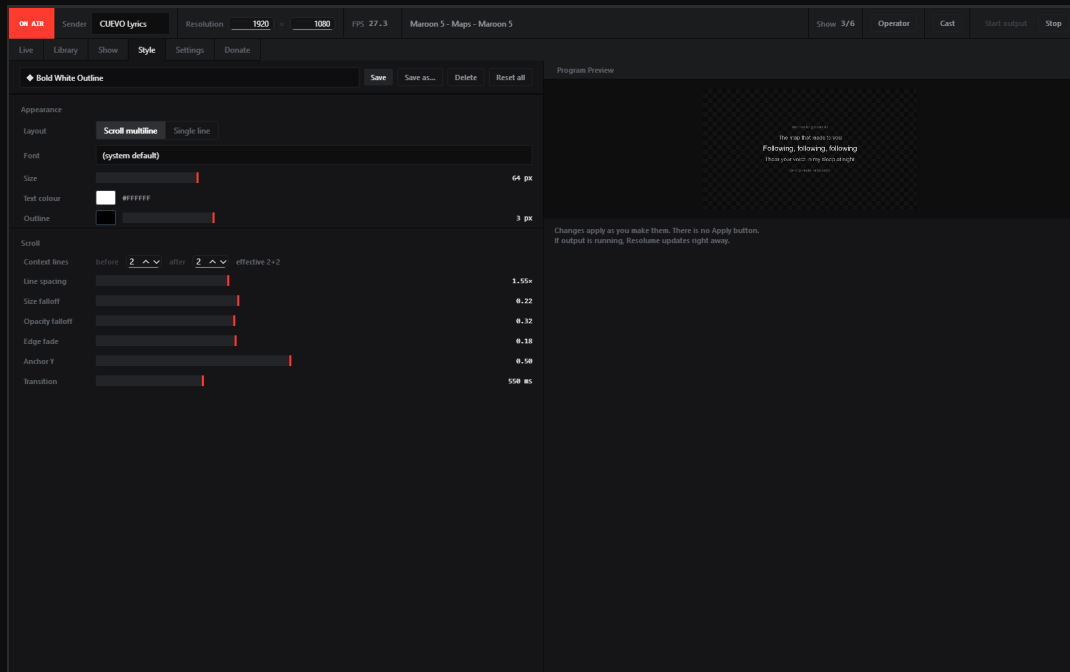

Tidak ketemu online? Buka editor manual untuk menulis lirik sendiri dan menandai waktunya sambil lagu diputar. Dari hasil pencarian atau dari library, pakai "Add to show" untuk memasukkan lagu langsung ke set list yang sedang terbuka.

3. Menyusun Show

Show adalah urutan lagu untuk satu acara. Tambahkan lagu dari library, urutkan dengan drag, lalu simpan semuanya ke file yang bisa dibuka lagi minggu depan. Navigasi lagu saat show berjalan dilakukan dari tab Live, sengaja begitu, supaya urutannya tidak tersenggol tanpa sengaja di tengah acara.

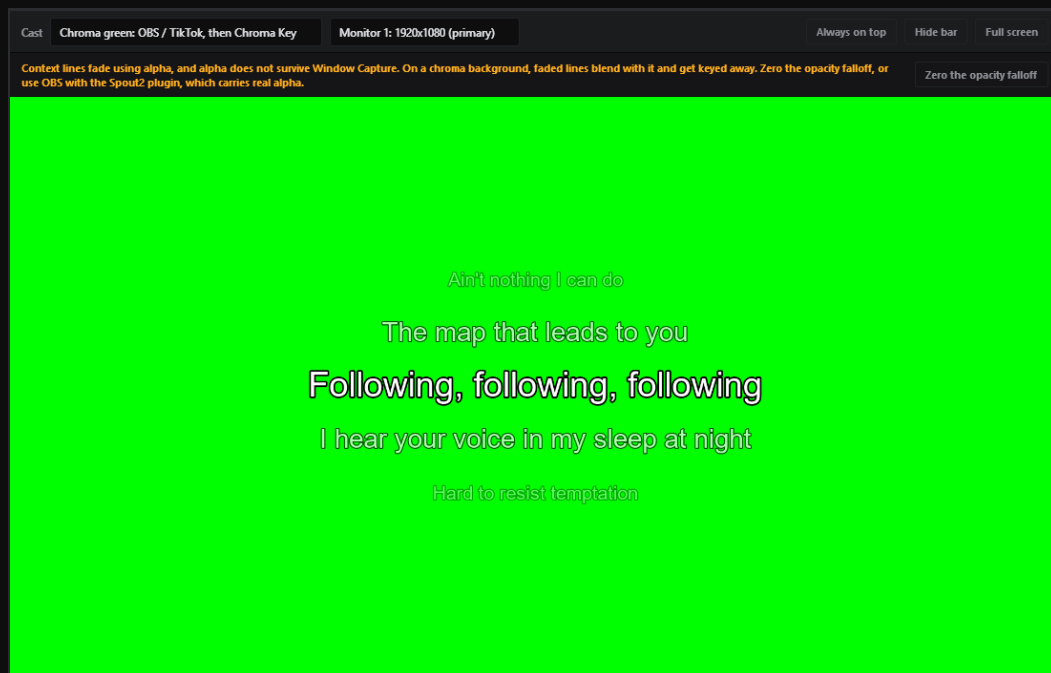

4. Mengatur tampilan

Semua yang visual ada di sini: layout (scroll multi-baris atau satu baris), font, ukuran, warna teks dan outline, jarak baris, seberapa cepat baris konteks mengecil dan memudar, dan kecepatan transisi. Perubahan langsung berlaku begitu kamu membuatnya, termasuk saat output sedang jalan, jadi kamu bisa menyetel sambil melihat preview bereaksi seketika.

Klik kanan kontrol mana pun untuk mengembalikannya ke default, gestur yang sama seperti di Resolume Arena sendiri. Simpan satu set nilai sebagai Template supaya tidak perlu menyusun ulang tampilan untuk show berikutnya.

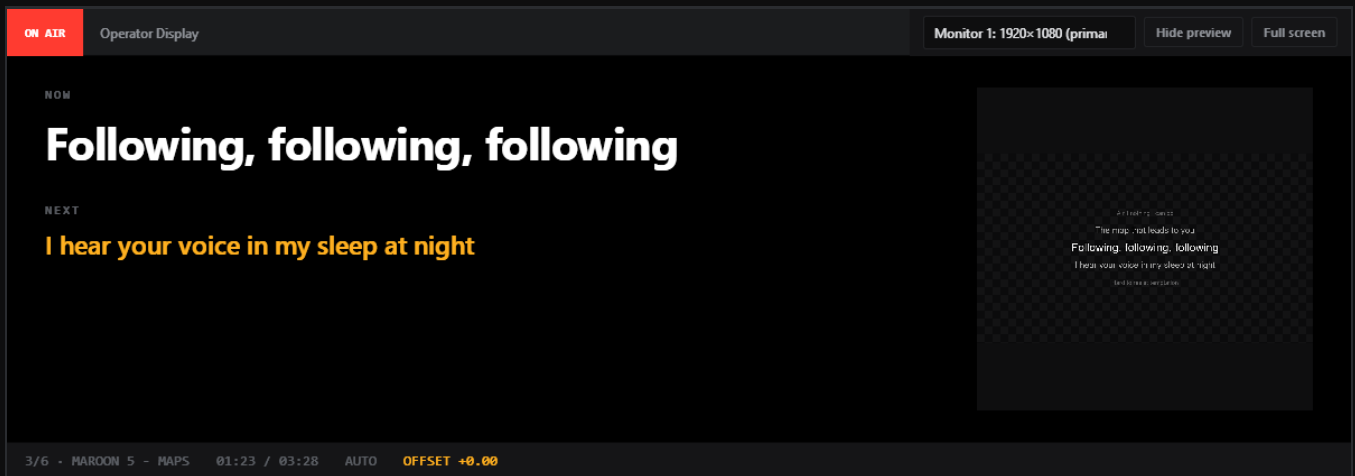

5. Mengirim ke OBS atau TikTok Live

Tombol Cast membuka jendela terpisah yang bisa ditangkap. Pilih Chroma green untuk Window Capture di OBS dengan filter Chroma Key, atau untuk Screen/Window Capture di TikTok Live Studio. Pilih Black dan sebuah monitor untuk layar kedua atau proyektor. Hide bar melepas bingkai jendela supaya tangkapannya bersih; Esc mengembalikannya.

Kalau kamu pakai plugin Spout2 di OBS, lewati jendela ini sama sekali dan tambahkan source Spout yang menunjuk ke sender "CUEVO Lyrics": alpha-nya asli dan tidak perlu chroma key sama sekali.

6. Operator Display

Jendela NOW/NEXT sederhana untuk monitor kedua, supaya siapa pun yang memandu show bisa melihat apa yang sedang main dan apa selanjutnya tanpa melihat jendela kontrol utama. Bar bawahnya menunjukkan posisi lagu, waktu berjalan, mode sinkron, dan offset saat ini.

Pemecahan masalah

■ **“SpoutGL/pygame belum terpasang”**

Paket Windows opsionalnya belum ada. Pasang ulang dengan `pip install -r requirements.txt` di Windows 64-bit, atau pakai .exe siap pakai dari halaman Releases.

■ **Resolume tidak melihat sender-nya**

Pastikan Start output sudah ditekan, sampai status strip menulis ON AIR bukan IDLE, dan jendela kecil pygame masih terbuka. Diminimize boleh, ditutup jangan.

■ **Lirik tidak ketemu di LRCLIB**

Buang embel-embel seperti “(Official Video)” dari pencarian. Kolom pencarian menerima judul dan artis bersamaan dalam urutan apa saja.

■ **Frame rate turun saat animasi**

Hindari ukuran font efektif di bawah sekitar 22px. Panel Style memperingatkan otomatis saat sebuah pengaturan hampir melewati batas itu.

■ **Windows memperingatkan “Unknown publisher” saat pertama dijalankan**

Build-nya tidak ditandatangani. Klik More info, lalu Run anyway. Kalau kamu tidak mau percaya begitu saja pada biner dari orang asing, source-nya publik dan kamu bisa membangunnya sendiri.
